

Name: _____

Class: _____

Earth Day Challenge: Home Light Bulb Audit

Your mission, should you choose to accept it, is to count the number of light bulbs in your home and calculate the savings if you switched to energy efficient lighting.

Record the **number of light bulbs** of each type in your home. Don't forget closets, the basement and the garage.

Most Energy Efficient Lighting

Number LED Bulbs: _____

Number Fluorescent (CFL or tube): _____

Less Energy Efficient Lighting

Number Incandescent Bulbs: _____

Other Light Bulbs: _____

Potential Cost Savings by Installing Energy Efficient Lighting

Number of less efficient bulbs that could be replaced in your home (from numbers above)

Lifecycle cost saving for replacing 1 less efficiency bulb (from reverse side)

Potential Lifecycle Cost Savings by installing efficient lighting

Comparing Light Bulbs

The graphic on the previous page shows four light bulbs that produce the same amount of light. You might use bulbs like these as a bright overhead light. One bulb is an incandescent light bulb (IL), one is a halogen, one is a compact fluorescent light (CFL), and another is a light emitting diode (LED). Which one is the better bargain? Let's do the math and compare the four light bulbs using the residential cost of electricity in Ohio at \$0.11/kWh.

1. Determine how many bulbs you will need to produce 25,000 hours of light by dividing 25,000 by the number of hours each bulb produces light.
2. Multiply the number of bulbs you will need to produce 25,000 hours of light by the price of each bulb. The cost of each bulb has been given to you in the chart below.
3. Multiply the wattage of the bulbs (using the kW number given) by 25,000 hours to determine kilowatt-hours (kWh) consumed.
4. Multiply the number of kilowatt-hours by the cost per kilowatt-hour to determine the cost of electricity to produce 25,000 hours of light.
5. Add the cost of the bulbs plus the cost of electricity to determine the life cycle cost for each bulb. Which one is the better bargain?
6. Compare the environmental impact of using each type of bulb. Multiply the total kWh consumption by the average amount of carbon dioxide produced by a power plant. This will give you the pounds of carbon dioxide produced over the life of each bulb. Which one has the least environmental impact?

All bulbs provide about 850 lumens of light.

COST OF BULB	INCANDESCENT BULB	HALOGEN	COMPACT FLUORESCENT (CFL)	LIGHT EMITTING DIODE (LED)
Life of bulb (how long it will light)	1,000 hours	3,000 hours	10,000 hours	25,000 hours
Number of bulbs to get 25,000 hours				
x Price per bulb	\$0.50	\$1.5	\$1.5	\$1.33
= Cost of bulbs for 25,000 hours of light				
COST OF ELECTRICITY	INCANDESCENT BULB	HALOGEN	COMPACT FLUORESCENT (CFL)	LIGHT EMITTING DIODE (LED)
Total Hours	25,000 hours	25,000 hours	25,000 hours	25,000 hours
x Wattage	60 watts = 0.060 kW	43 watts = 0.043 kW	13 watts = 0.013 kW	12 watts = 0.012 kW
= Total kWh consumption				
x Price of electricity per kWh	\$0.11	\$0.11	\$0.11	\$0.11
= Cost of Electricity				
LIFE CYCLE COST	INCANDESCENT BULB	HALOGEN	COMPACT FLUORESCENT (CFL)	LIGHT EMITTING DIODE (LED)
Cost of bulbs				
+ Cost of electricity				
= Life cycle cost				
ENVIRONMENTAL IMPACT	INCANDESCENT BULB	HALOGEN	COMPACT FLUORESCENT (CFL)	LIGHT EMITTING DIODE (LED)
Total kWh consumption				
x Pounds (lbs) of carbon dioxide per kWh	1.6 lb/kWh	1.6 lb/kWh	1.6 lb/kWh	1.6 lb/kWh
= Pounds of carbon dioxide produced				

Savings

Incandescent Life Cycle Cost

LED Life Cycle Cost

Life Cycle Savings for replacing one IL with a LED
